ADRF5714

Silicon Digital Attenuator, 1-Bit, 100 MHz to 30 GHz

FEATURES

- Ultrawideband frequency range: 100 MHz to 30 GHz
- 16 dB single attenuation step
- Low insertion loss
  - 0.7 dB at 8 GHz
  - 0.9 dB at 18 GHz
  - 1.3 dB at 30 GHz
- Attenuation accuracy: ±0.20 dB typical at up to 30 GHz
- High input linearity
  - P0.1dB insertion loss state: 33 dBm typical
  - P0.1dB 16 dB attenuation state: 30 dBm typical
  - IP3 insertion loss state: 51 dBm typical
  - IP3 16 dB attenuation state: 49 dBm typical
- High RF power handling
  - 30 dBm typical steady state average
  - 33 dBm typical steady state peak
- RF amplitude settling time (0.1 dB of final RF_{OUT}): 110 ns typical
- Single-supply operation supported
- Tight distribution in relative phase
- No low frequency spurious signals
- CMOS-/LVTTL-compatible
- 12-terminal, 2.25 mm x 2.25 mm, land grid array [LGA] package

APPLICATIONS

- Industrial scanners
- Test and instrumentation
- Cellular infrastructure: 5G millimeter wave
- Military radios, radars, electronic counter measures (ECMs)
- Microwave radios and very small aperture terminals (VSATs)

GENERAL DESCRIPTION

The ADRF5714 is a silicon, 1-bit digital attenuator with 16 dB attenuation, which supports glitch-free operation.

This device operates from 100 MHz to 30 GHz with better than 1.3 dB of insertion loss and excellent attenuation accuracy. The ATTIN and ATTOUT port of the ADRF5714 has an RF input power handling capability of 30 dBm average and 33 dBm peak.

The ADRF5714 requires a dual-supply voltage of +3.3 V and −3.3 V. The device features CMOS-/low voltage transistor to transistor logic (LVTTL)-compatible control.

The ADRF5714 can also operate with a single positive supply voltage (V_{DD}) applied while the negative supply voltage (V_{SS}) is tied to ground. See the Theory of Operation section for more details.

The ADRF5714 RF ports are designed to match a characteristic impedance of 50 Ω. The ADRF5714 comes in a 12-terminal, 2.25 mm × 2.25 mm, RoHS compliant, LGA package and operates from −40°C to +105°C.

[2] For 105°C operation, the power handling degrades from the T_{CASE} = 85°C specification by 3 dB.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

THERMAL RESISTANCE

Thermal performance is directly linked to printed circuit board (PCB) design and operating environment. Careful attention to PCB thermal design is required.

θ_{JC} is the junction to case bottom (channel to package bottom) thermal resistance.

Table 4. Thermal Resistance

Package Type	θ_{JC}[1]	Unit
CC-12-6	50	°C/W

[1] θ_{JC} was determined by simulation under the following conditions: the heat transfer is due solely to thermal conduction from the channel through the ground pad to the PCB, and the ground pad is held constant at the operating temperature of 85°C.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

THEORY OF OPERATION

The ADRF5714 incorporates a 1-bit attenuator that offers an attenuation range of 16 dB. The ADRF5714 has a digital control input, D0, to select the desired state, as shown in Figure 19. See Table 7 for the truth table.

Table 7. Truth Table

Digital Control Input (D0)	Attenuation State (dB)
Low	0 (reference)
High	16

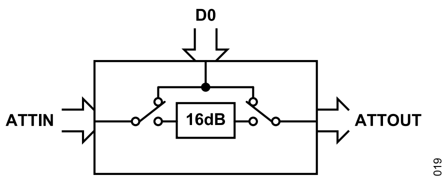

Figure 19. Simplified Circuit Diagram

RF INPUT AND OUTPUT

Both RF ports (ATTIN and ATTOUT) are DC-coupled to 0 V. No DC blocking is required at the RF ports when the RF line potential is equal to 0 V.

The RF ports are internally matched to 50 Ω. Therefore, external matching components are not required.

The ADRF5714 supports bidirectional operation at the same power level. The power handling of the ATTIN and ATTOUT ports are the same. Refer to the RF input power specifications in Table 1.

The ADRF5714 can operate with a single positive supply voltage applied to the VDD pin, and the VSS pin connected to ground. However, some performance degradations can occur in the input compression and input third-order intercept (see Table 2).

POWER SUPPLY

The ADRF5714 requires a positive supply voltage applied to the VDD pin, and a negative supply voltage applied to the VSS pin. Bypassing capacitors are recommended on the supply lines to filter high frequency noise.

The ideal power-up sequence is as follows:

1. Connect GND.
2. Power up VDD and VSS. Power up VSS after VDD to avoid current transients on VDD during ramp up.
3. Apply the digital control input. However, powering the digital control input before the VDD supply can inadvertently forward bias and damage the internal ESD protection structures. To avoid this damage, use a series 1 kΩ resistor to limit the current flowing into the control pin. Use pull-up or pull-down resistors if the controller output is in a high impedance state after VDD is powered up and the control pin is not driven to a valid logic state.
4. Apply an RF input signal to ATTIN or ATTOUT.

The ideal power-down sequence is the reverse order of the power-up sequence.

APPLICATIONS INFORMATION

The RF transmission lines are designed using a coplanar waveguide (CPWG) model with a trace width of 16 mil and ground clearance of 6 mil to have a characteristic impedance of 50 Ω. For optimal RF and thermal grounding, as many through vias as possible are arranged around transmission lines and under the exposed pad of the package.

The RF input and output ports (ATTIN and ATTOUT) are connected through 50 Ω transmission lines. On the VDD and VSS supply traces, a 100 pF bypass capacitor filters high frequency noise.

Figure 20 shows the simplified application circuit for the ADRF5714.

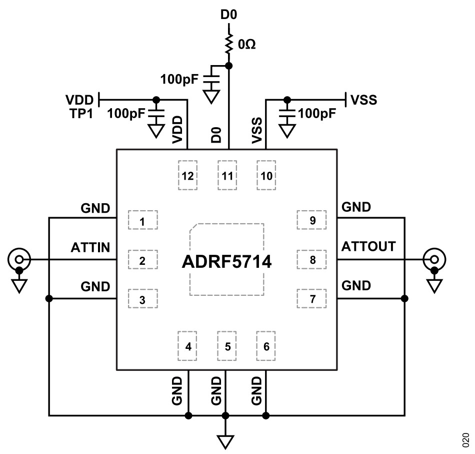

Figure 20. Simplified Application Circuit

RECOMMENDATIONS FOR PCB DESIGN

The RF ports are matched to 50 Ω internally, and the pinout is designed to mate a CPWG with a 50 Ω characteristic impedance on the PCB. Figure 21 shows the referenced CPWG RF trace design for an RF substrate with 12 mil thick Rogers RO4003 dielectric material. The RF trace with a 16 mil width and a 6 mil clearance is recommended for 2.2 mil finished copper thickness.

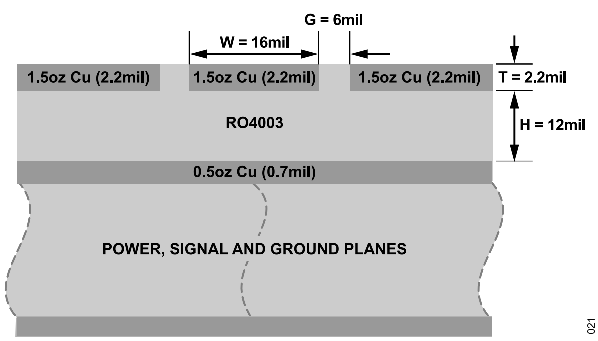

Figure 21. Example PCB Stackup

Figure 22 shows the routing of the RF traces, supply, and control signals from the ADRF5714. The ground planes are connected with as many filled through vias as allowed for optimal RF and thermal performance. The primary thermal path for the device is the bottom side.

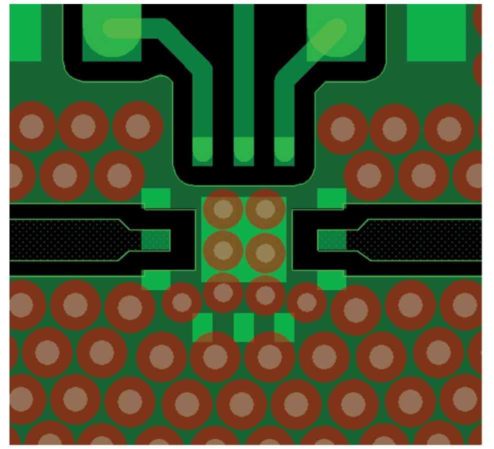

Figure 22. PCB Routings

Figure 23 shows the recommended layout from the ATTIN and ATTOUT pins of the ADRF5714 to the 50 Ω CPWG on the referenced stackup. PCB pads are drawn 1:1 to device pads. The ground pads are drawn solder mask defined, and the signal pads are drawn as pad defined. The RF trace from the PCB pad is extended with the same 2 mil width and tapered with a 90° angle. The paste mask is also designed to match the pad without any aperture reduction. The paste is divided into multiple openings for the paddle.
